

Leptopsammia pruvoti Lacaze-Duthiers, 1897

AphiaID: 135193

SUNSET CUP CORAL

Biota (Superdomínio) > Leptopsammia (Genero)

Identifying features

- Almost always solitary but sometimes found as small groups of corallia arising from one base (pseudocolonies).
- The disk and tentacles are usually yellow, sometimes with an orange disk.
- The polyp sits in a porous calcified skeleton.
- Possesses about 96 tentacles.
- Attached to bedrock or stable boulders in crevices, caves or overhangs.

- The corallum may be from short and cylindrical to tall and inversely conical, height to 60 mm, diameter of the calyx to 17 mm.

Synonyms

Leptopsammia microcardia Döderlein, 1913
